| Fees | £9,250 (full-time, per year) |

About this programme

This programme will enable students to develop a critical awareness of the potential factors that can influence the health and wellbeing of individuals, their communities and populations nationally and globally.

Students will examine and reflect upon the contribution of multidisciplinary and inter-professional team working, and how to operate in a collaborative way as an effective member of the team. Crucially, this will also allow students to develop and advance their knowledge of current and future health and social care needs of individuals and communities, ensuring that the views of service users, carers and other stakeholders are fully represented in care processes.

This degree is structured to provide you with an extensive look into health and social care work from management, regulation and compliance to how biological, psychological and sociological factors of human development influence the sector.

Upon completion of the degree, successful students will be equipped with the appropriate knowledge and skills to pursue a career in health and social care.

Careers

Graduate employment opportunities that might be available to graduates of the programme could include:

- Healthcare Manager
- Occupational Therapy Assistant
- Psychological Wellbeing Practitioner
- Primary Care Graduate Mental Health Worker
- Progression to PG Study to access further careers: e.g. Nursing, Public Health, Social Work)

Key Features

- Analysing healthcare systems; by exploring how health and social care providers and organisations are managed, regulated, integrated and their ability (severally and collectively) to meet the health and social care needs of the populations they serve
- Understanding health and social care workers and the different roles and responsibilities of professionals operating within the sector
- Examining the biological, psychological and sociological factors of human development, to critically analyse their influence upon the health and wellbeing of individuals throughout the lifespan
- Analysing the nature of health and social inequalities and evaluating their relationship to a range of contemporary issues identified locally, nationally, internationally and globally.

Modules
